6 March 1963

MEMORANDUM FOR : The Record
SUBJECT : OXCART Flight Test Status: 5 March

1. Aircraft #122 (equipped with J58 engines) made flight #5, 5 March, for a duration of fifty-six minutes. The purpose of the flight was to extend the aircraft flight envelope and to obtain additional lateral directional stability data. Preliminary reports indicate that a speed of Mach 2.35 and an altitude in excess of 62,000 feet were attained. This is the highest altitude and speed thus far achieved in flight test. During the flight an inlet-duct airflow instability was encountered above the Mach 1.8 region after the bypass doors were put on automatic, which is not an unusual problem at this exploratory stage of flight test. Some cockpit overheating also occurred during this flight. The left side gearbox is being replaced in this aircraft after preliminary postflight checks reportedly revealed an aircraft fuel pump leakage malfunction. The next flight of Aircraft #122 tentatively is scheduled for 8 March.
2. Aircraft #124 (trainer with J75 engines) made flights #36 and #37, 5 March, each for a duration of one hour and thirty minutes:
 - a. Flight #36, a familiarization flight for Agency pilots, was regarded as routine including normal drag chute deployment during the landing run. The pilots commented favorably about the reduction of glare due to the use of glare shields and anti-reflective black paint in the cockpit.
 - b. Flight #37, a refamiliarization training flight for two Agency pilots, was successfully accomplished and regarded as routine. Drag chute deployment was slow upon landing.
